I. Handling Precautions

- 1) Since front polarizer is easily damaged, pay attention not to scratch it.
- 2) Be sure to turn off power supply when inserting or disconnecting from input connector.
- 3) Wipe off water drop immediately. Long contact with water may cause discoloration or spots.
- 4) When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.
- 5) Since the panel is made of glass, it may break or crack if dropped or bumped on hard surface.
- 6) Since CMOS LSI is used in this module, take care of static electricity and insure human earth when handling.
- 7) Do not open or modify the Module Assembly.
- 8) Do not press the reflector sheet at the back of the module to any directions.
- 9) In case if a Module has to be put back into the packing container slot after it was taken out from the container, do not press the center of LED lightbar edge. Instead, press at the far ends of the LED light bar edge softly. Otherwise the TFT Module may be damaged.
- 10) At the insertion or removal of the Signal Interface Connector, be sure not to rotate nor tilt the Interface Connector of the TFT Module.
- 11) After installation of the TFT Module into an enclosure, do not twist nor bend the TFT Module even momentarily. While designing the enclosure, it should be taken into consideration that no bending/twisting forces are applied to the TFT Module from outside. Otherwise the TFT Module may be damaged.
- 12) Small amount of materials having no flammability grade is used in the LCD module. The LCD module should be supplied by power complied with requirements of Limited Power Source (IEC60950-1 or UL60950-1), or be applied exemption.

Note 1: Measurement method

The LCD module should be stabilized at given temperature for 30 minutes to avoid abrupt temperature change during measuring (at surface 35°C). In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 30 minutes in a stable, windless and dark room.

Note 2: Definition of viewing angle measured by ELDIM (EZContrast 88)

Viewing angle is the measurement of contrast ratio ≥ 10 , at the screen center, over a 180° horizontal and 180° vertical range (off-normal viewing angles). The 180° viewing angle range is broken down as follows; 90° (θ) horizontal left and right and 90° (ϕ) vertical, high (up) and low (down). The measurement direction is typically perpendicular to the display surface with the screen rotated about its center to develop the desired measurement viewing angle.

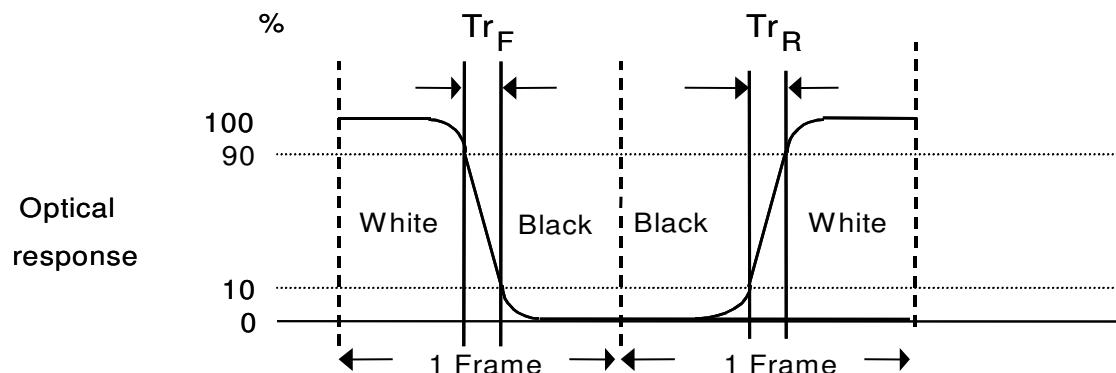

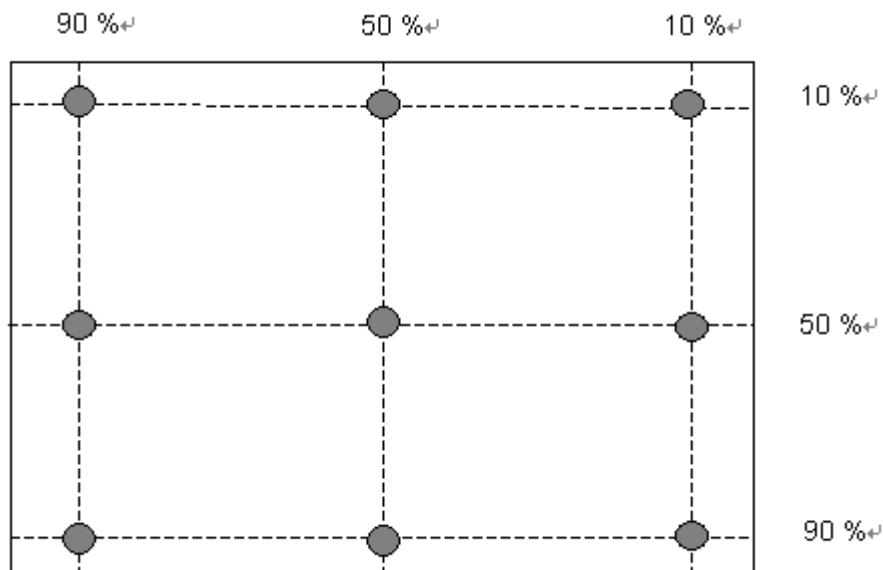

Note 3: Contrast ratio is measured by TOPCON SR-3

Note 4: Definition of Response time measured by Westar TRD-100A

The output signals of photo detector are measured when the input signals are changed from "Full Black" to "Full White" (rising time, Tr_R), and from "Full White" to "Full Black" (falling time, Tr_F), respectively. The response time is interval between the 10% and 90% (1 frame at 60 Hz) of amplitudes.

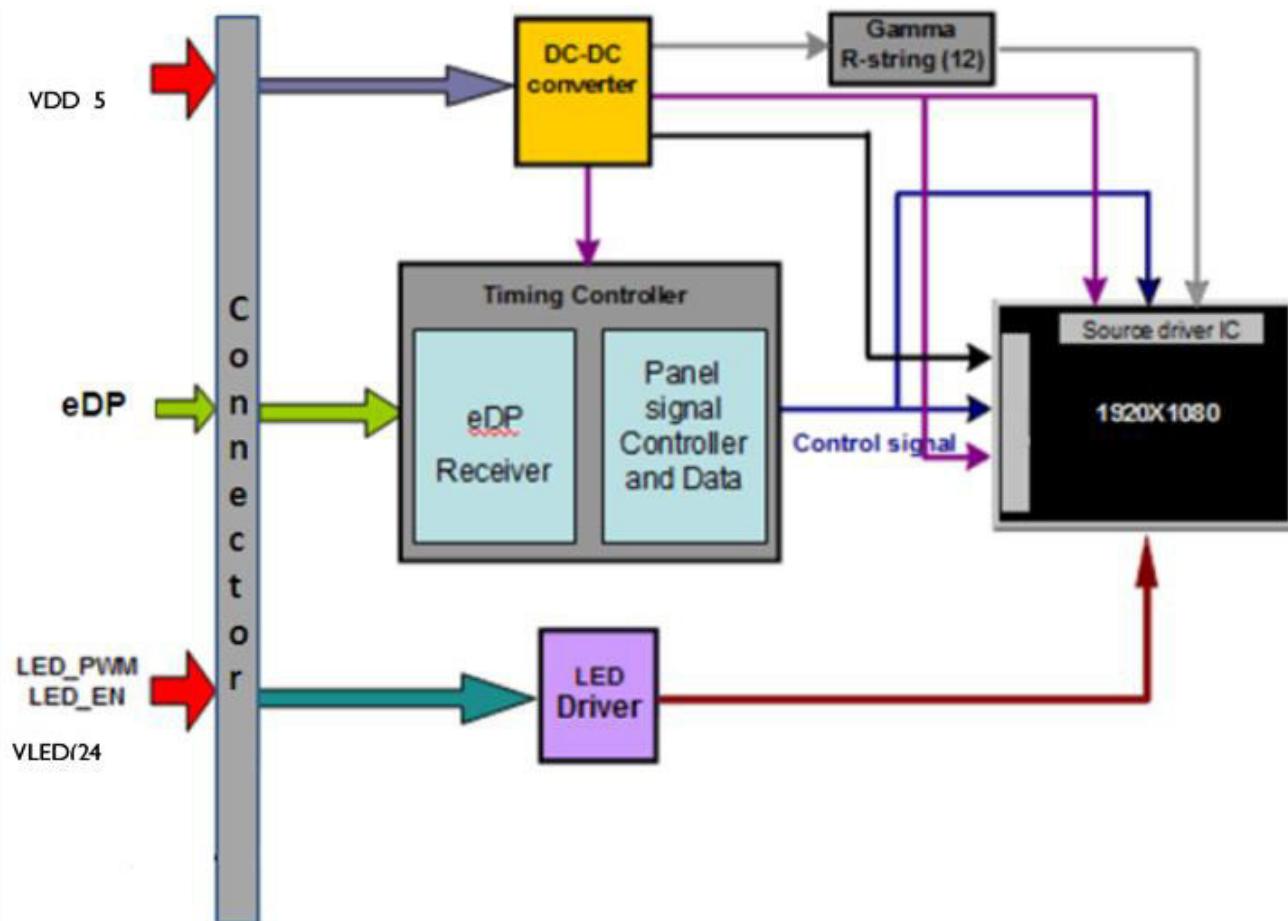

$$Tr_R + Tr_F = 20 \text{ msec (typ.)}$$

**Note 5:** Color chromaticity and coordinates (CIE) is measured by TOPCON SR-3**Note 6:** Central luminance is measured by TOPCON SR-3**Note 7:** Luminance uniformity of these 9 points is defined as below and measured by TOPCON SR-3

$$\text{Uniformity} = \frac{\text{Minimum Luminance in 9 points(1 - 9)}}{\text{Maximum Luminance in 9 Points(1 - 9)}}$$

Display Port panel power sequence timing parameter:

| Timing parameter | Description | Reqd. by | Limits | | | Notes |
|------------------|---|----------|--------|------|-------|--|
| | | | Min. | Typ. | Max. | |
| T1 | power rail rise time, 10% to 90% | source | 0.5ms | | 10ms | |

| T3 | delay from LCDVDD to HPD high | sink | 0ms | | 200ms | sink AUX_CH must be operational upon HPD high. |
| T4 | delay from HPD high to link training initialization | source | | | | allows for source to read link capability and initialize. |
| T5 | link training duration | source | | | | dependant on source link to read training protocol. |
| T6 | link idle | source | | | | Min accounts for required BS-Idle pattern. Max allows for source frame synchronization. |
| T7 | delay from valid video data from source to video on display | sink | 0ms | | 50ms | max allows sink validate video data and timing. |
| T8 | delay from valid video data from source to backlight enable | source | | | | source must assure display video is stable. |
| T9 | delay from backlight disable to end of valid video data | source | | | | source must assure backlight is no longer illuminated. |
| T10 | delay from end of valid video data from source to power off | source | 0ms | | 500ms | |

Note 1: The sink must include the ability to generate black video autonomously. The sink must automatically enable black video under the following conditions:

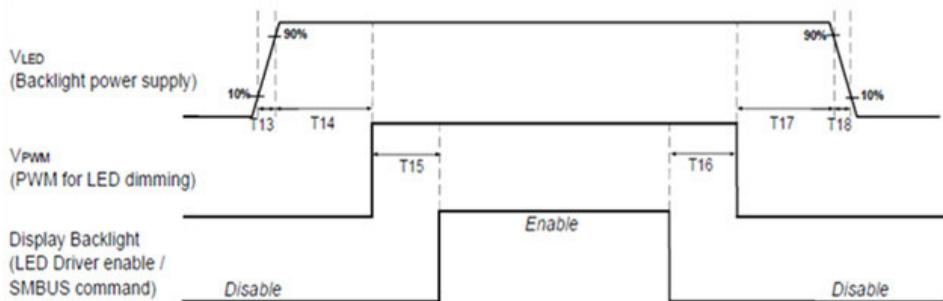

-upon LCDVDD power on (with in T2 max)-when the "Novideostream_Flag" (VB-ID Bit 3) is received from the source (at the end of T9).

-when no main link data, or invalid video data, is received from the source. Black video must be displayed within 64ms (typ) from the start of either condition. Video data can be deemed invalid based on MSA and timing information, for example.

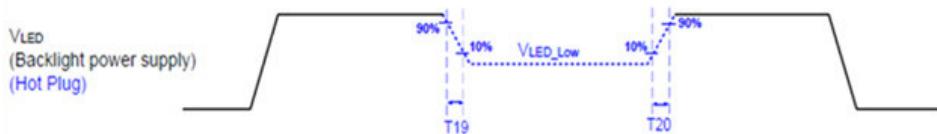

Note 2: The sink may implement the ability to disable the black video function, as described in Note 1, above, for system development and debugging purpose.

Note 3: The sink must support AUX_CH polling by the source immediately following LCDVDD power on without causing damage to the sink device (the source can re-try if the sink is not ready). The sink must be able to respond to an AUX_CH transaction with the time specified within T3 max.

Display Port panel B/L power sequence timing parameter:

Note : When the adapter is hot plugged, the backlight power supply sequence is shown as below.

| | Min (ms) | Max (ms) |
