1. GENERAL DESCRIPTION

1.1 OVERVIEW

G121ICE-LH1 is a 12.1" TFT Liquid Crystal Display module with LED Backlight unit LVDS interface. This module supports 1280 x 800 Wide-XGA AAS mode and can display 262k/16.7M colors . The LED converter for Backlight is built in control board..

1.2 FEATURE

- WXGA (1280 x 800 pixels) resolution
- PSWG (Panel Standardization Working Group)
- Wide operating temperature.
- RoHS compliance

1.3 APPLICATION

- TFT LCD Monitor
- Factory Application
- Amusement

1.4 GENERAL SPECIFICATIONS

Item	Specification	Unit	Note

Weight		-	470	490	g	

Note (1) Please refer to the attached drawings for more information of front and back outline dimensions.

Note (2) The Module Power Consumption is specified at 3.3V, white pattern and 100% duty for LED backlight

2. ABSOLUTE MAXIMUM RATINGS

2.1 ABSOLUTE RATINGS OF ENVIRONMENT

Item	Symbol	Value		Unit	Note
		Min.	Max.		
Operating Ambient Temperature	T _{OP}	-30	+80	°C	(1)(2)
Storage Temperature	T _{ST}	-30	+85	°C	

Note (1)

- (a) 90 %RH Max. (Ta ≤ 39 °C)
- (b) Wet-bulb temperature should be 39 °C Max.
- (c) No condensation.

Note (2) Panel surface temperature should be 0°C min. and 80°C max under Vcc=3.3V, fr =60Hz, typical LED string current, 25°C ambient temperature, and no humidity control . Any condition of ambient operating temperature ,the surface of active area should be keeping not higher than 80°C.(Panel surface temperature).

2.2 ELECTRICAL ABSOLUTE RATINGS

2.2.1 TFT LCD MODULE

Item	Symbol	Value		Unit	Note
		Min.	Max.

Differential Input Voltage for LVDS Receiver Threshold	"H" Level	V_{IH}	100	-	-	mV	-
	"L" Level	V_{IL}	-	-	-100	mV	-
Terminating Resistor		R_T	-	100	-	Ohm	-

Note (1) The module should be always operated within above ranges.

Note (2) Measurement Conditions:

VCC rising time is 470us

Note (3) The specified power supply current is under the conditions at $V_{DD} = 3.3V$, $T_a = 25 \pm 2^\circ C$, DC Current and $f_v = 60$ Hz, whereas a power dissipation check pattern below is displayed.

PWM Dimming Control Duty Ratio		-	5	-	100	%	(2), Suggestion @ 190Hz<f _{PWM} <1kHz
			20	-	100	%	(2), @ 1kHz≤f _{PWM} <20kHz
LED Life Time		L _{LED}	50,000		-	Hrs	(3)

Note (1) LED current is measured by utilizing a high frequency current meter as shown below:

Note (2) At 190 ~1kHz PWM control frequency, duty ratio range is restricted from 5% to 100%.

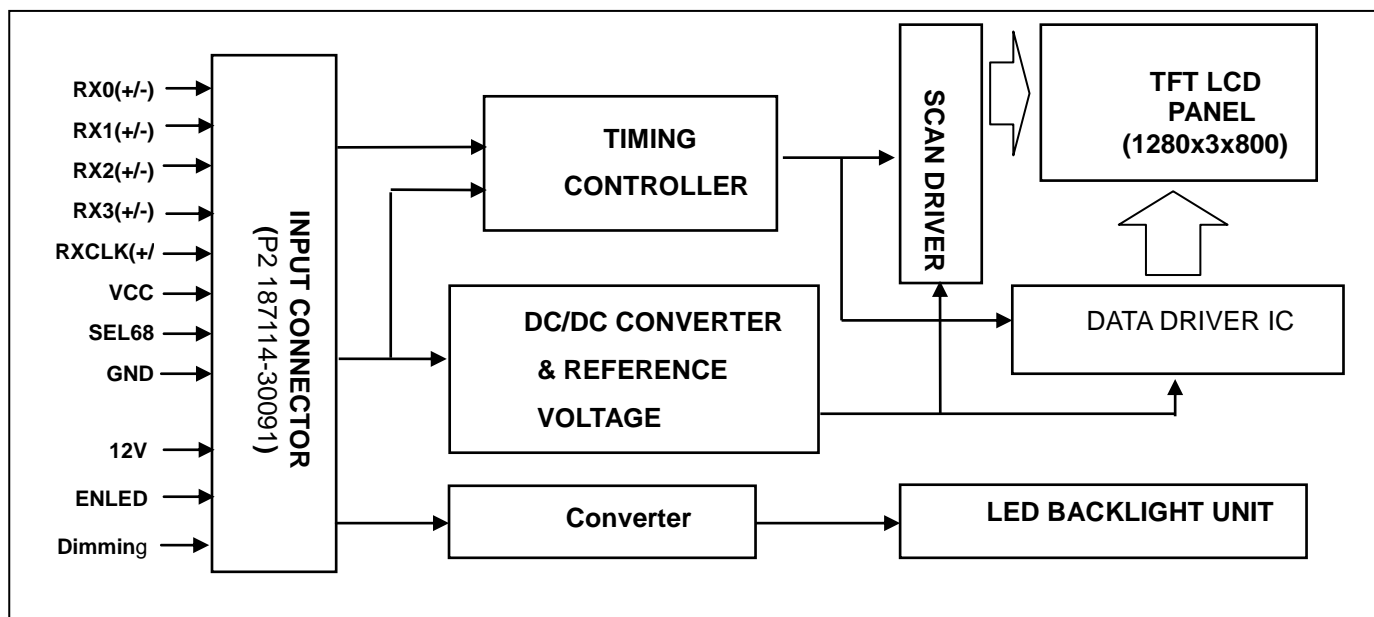

1K ~20kHz PWM control frequency, duty ratio range is restricted from 20% to 100%.

If PWM control frequency is applied in the range from 1KHz to 20KHZ, The “non-linear” phenomenon on the Backlight Unit may be found. So It’s a suggestion that PWM control frequency should be less than 1KHz.

Note (3) The lifetime of LED is estimated data and defined as the time when it continues to operate under the conditions at Ta = 25 ±2 °C and Duty 100% until the brightness becomes ≤ 50% of its original value. Operating LED at high temperature condition will reduce life time and lead to color shift.

6. INTERFACE TIMING

6.1 INPUT SIGNAL TIMING SPECIFICATIONS

The input signal timing specifications are shown as the following table and timing diagram.

Signal	Item	Symbol	Min.	Typ.	Max.	Unit	Note
LVDS Clock	Frequency	F_r	65.9	71	85	MHz	-
	Period	T_c	13.4	14.1	15.2	ns	
	Input cycle to cycle jitter	T_{rdl}	---	---	200	ns	(a)
	Input Clock to data skew	TLVCCS	$-0.02 \cdot T_c$	---	$0.02 \cdot T_c$	ps	(b)
	Spread spectrum modulation range	F_{clkin_mod}	$0.987 \cdot F_c$	---	$1.013 \cdot F_c$	MHz	(c)
	Spread spectrum modulation frequency	F_{SSM}	---	---	200	KHz	
Vertical Display Term	Frame Rate	F_r	---	60	---	Hz	$T_v = T_{vd} + T_{vb}$
	Total	T_v	808	823	885	T_h	-
	Active Display	T_{vd}	800	800	800	T_h	-
	Blank	T_{vb}	8	23	85	T_h	-
Horizontal Display Term	Total	T_h	1360	1440	1600	T_c	$T_h = T_{hd} + T_{hb}$
	Active Display	T_{hd}	1280	1280	1280	T_c	-
	Blank	T_{hb}	80	160	320	T_c	-

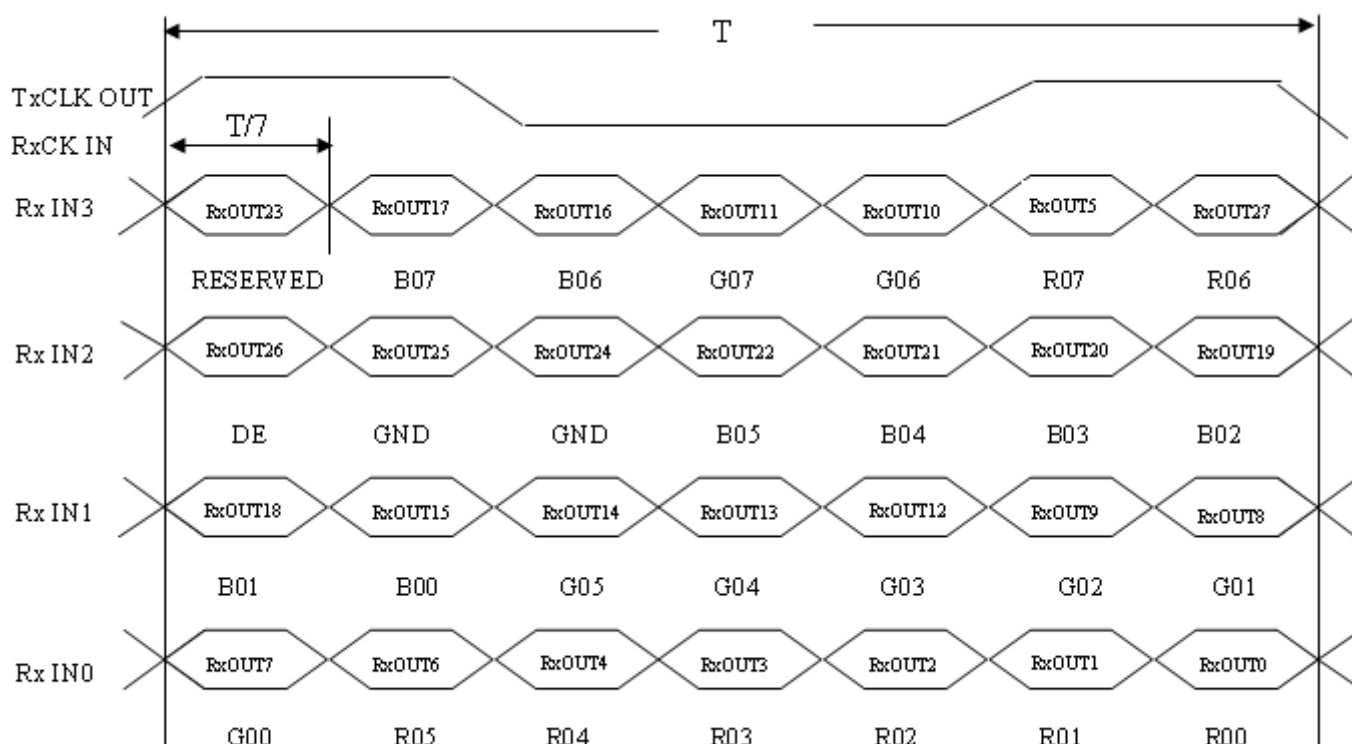

Note (1) Because this module is operated by DE only mode, Hsync and Vsync input signals should be set to low logic level or ground. Otherwise, this module would operate abnormally.

Note (2) The $T_v(T_{vd}+T_{vb})$ must be integer, otherwise, the module would operate abnormally.

INPUT SIGNAL TIMING DIAGRAM

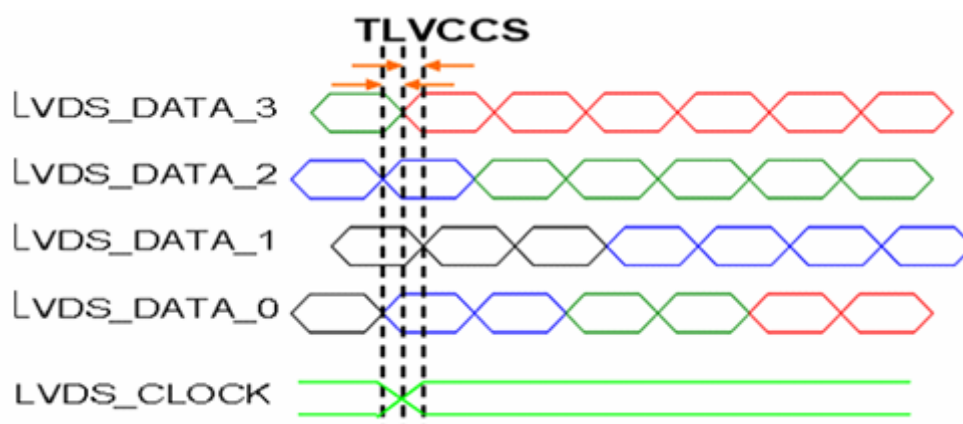

TIMING DIAGRAM of LVDS

Note (a) The input clock cycle-to-cycle jitter is defined as below figures. $T_{rcl} = |T_1 - T_1|$

Note (b) Input Clock to data skew is defined as below figures.

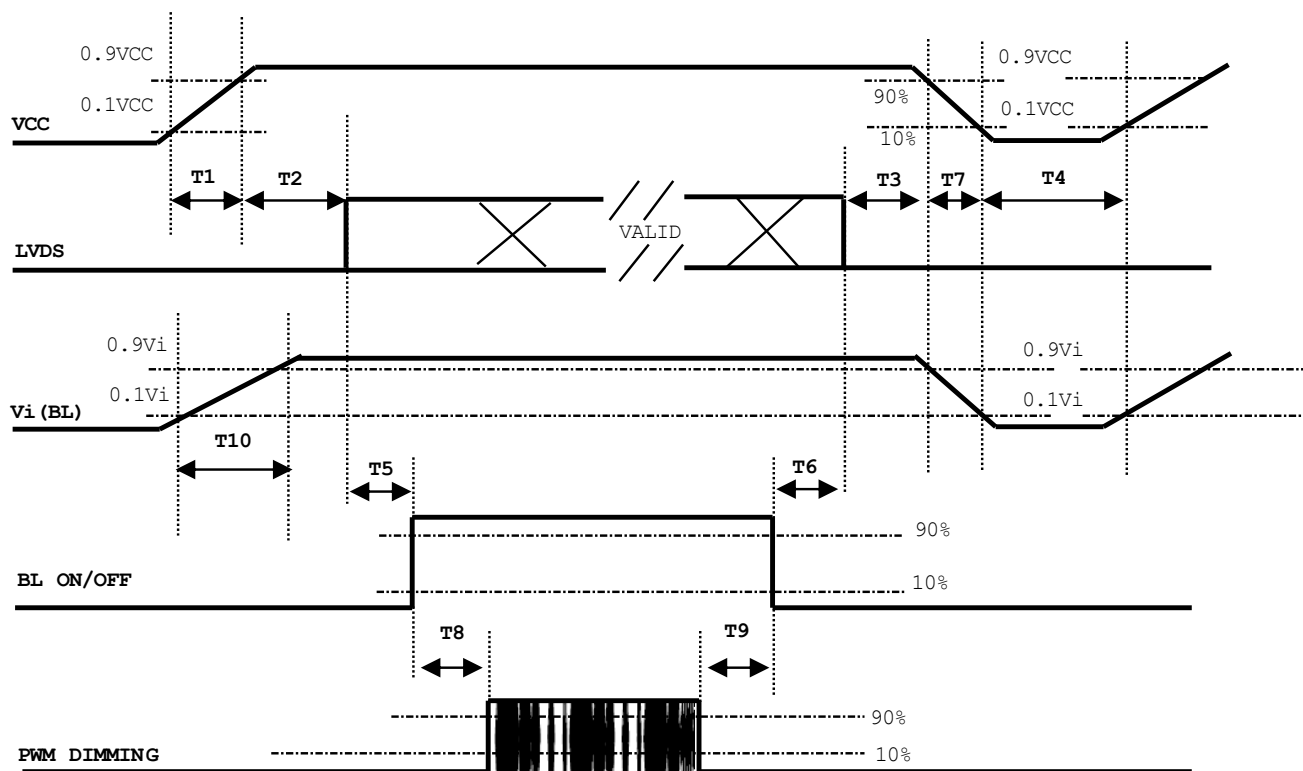

Note (c) The SSCG (Spread spectrum clock generator) is defined as below figures.

6.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD assembly, the power on/off sequence should be as the diagram below.

Parameter	Value			Units
	Min	Typ	Max	
T1	0.5	-	10	ms
T2	0	-	50	ms
T3	0	-	50	ms
T4	500	-	-	ms
T5	450	-	-	ms
T6	200	-	-	ms
T7	10	-	100	ms
T8	10	-	-	ms
T9	10	-	-	ms
T10	20	-	50	ms

Note:

- (1) The supply voltage of the external system for the module input should be the same as the definition of Vcc.
- (2) When the backlight turns on before the LCD operation of the LCD turns off, the display may momentarily become abnormal screen.
- (3) In case of VCC = off level, please keep the level of input signals on the low or keep a high impedance.
- (4) T4 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.
- (6) INX won't take any responsibility for the products which are damaged by the customers not following the Power Sequence.
- (7) There might be slight electronic noise when LCD is turned off (even backlight unit is also off). To avoid this symptom, we suggest "Vcc falling timing" to follow "T7 spec".

6.3 The INPUT DATA FORMAT

SEL 6/8="Low" for 6 Bits LVDS

SEL 6/8="High" for 8 Bits LVDS

Definition :

Grayscale Maximum : Grayscale 255 (10 bits: grayscale 1023 ; 8 bits : grayscale 255 ; 6 bits: grayscale 63)

White : Luminance of Grayscale Maximum (All R,G,B)

Black : Luminance of grayscale 0 (All R,G,B)

Note (1) Definition of Viewing Angle (θ_x , θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression at center point.

$$\text{Contrast Ratio (CR)} = \text{White} / \text{Black}$$

Note (3) Definition of Response Time (T_R , T_F):

Note (4) Definition of Luminance of White (L_c):

Measure the luminance of White at center point.

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 40 minutes in a windless room. The measurement placement of module should be in accordance with module drawing.

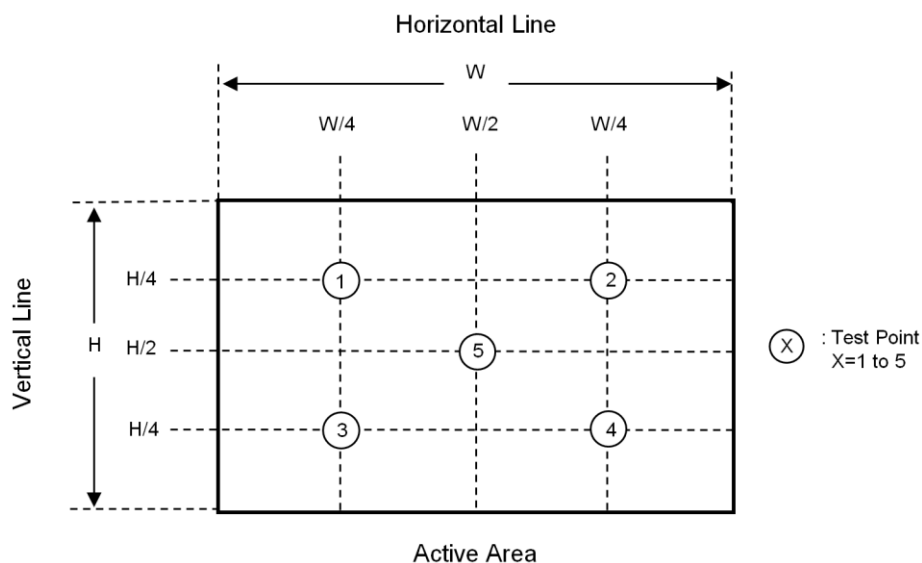

Note (6) Definition of White Variation (δW):

Measure the luminance of White at 5 points.

Luminance of White : $L(X)$, where X is from 1 to 5.

$$\delta W = \frac{\text{Minimum [} L(1) \text{ to } L(5) \text{]}}{\text{Maximum [} L(1) \text{ to } L(5) \text{]}} \times 100\%$$

8. RELIABILITY TEST CRITERIA

Test Item	Test Condition	Note
High Temperature Storage Test	85°C, 240 hours	(1), (2) (4), (5)
Low Temperature Storage Test	-30°C, 240 hours	
Thermal Shock Storage Test	-20°C, 0.5 hour ↔ 60°C, 0.5 hour; 100cycles, 1 hour/cycle)	
High Temperature Operation Test	80°C, 240 hours	
Low Temperature Operation Test	-30°C, 240 hours	
High Temperature & High Humidity Operation Test	60°C, RH 90%, 240 hours	
ESD Test (Operation)	150pF, 330Ω, 1 sec/cycle Condition 1 : panel contact, ±8 KV Condition 2 : panel non-contact ±15 KV	(1), (4)
Shock (Non-Operating)	200G, 2ms, half sine wave, 1 time for ± X, ± Y, ± Z direction	(2), (3)
Vibration (Non-Operating)	1.5G, 10 ~ 300 Hz sine wave, 10 min/cycle, 3 cycles each X, Y, Z direction	

Note (1) There should be no condensation on the surface of panel during test ,

Note (2) Temperature of panel display surface area should be 80°C Max.

Note (3) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

Note (4) In the standard conditions, there is no function failure issue occurred. All the cosmetic specification is judged before reliability test.

Note (5) Before cosmetic and function test, the product must have enough recovery time, at least 24 hours at room temperature.

9. PACKAGING

9.1 PACKING SPECIFICATIONS

- (1) 18pcs LCD modules / 1 Box
- (2) Box dimensions: 465 (L) X 362 (W) X 314 (H) mm
- (3) Weight: approximately 10.15 Kg (18 modules per box)

10. DEFINITION OF LABELS

10.1 INX MODULE LABEL

The barcode nameplate is pasted on each module as illustration, and its definitions are as following explanation.

Note (1) Safety Compliance(UL logo) will open after C1 version.

(a) Model Name: G121ICE-LH1

(b) * * * * : Factory ID

(c) Serial ID: X X X X X X Y M D X N N N N

Serial ID includes the information as below:

(a) Manufactured Date: Year: 1~9, for 2021~2029

Month: 1~9, A~C, for Jan. ~ Dec.

Day: 1~9, A~Y, for 1st to 31st, exclude I , O and U

(b) Revision Code: cover all the change

(c) Serial No.: Manufacturing sequence of product

11. PRECAUTIONS

11.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the lamp wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

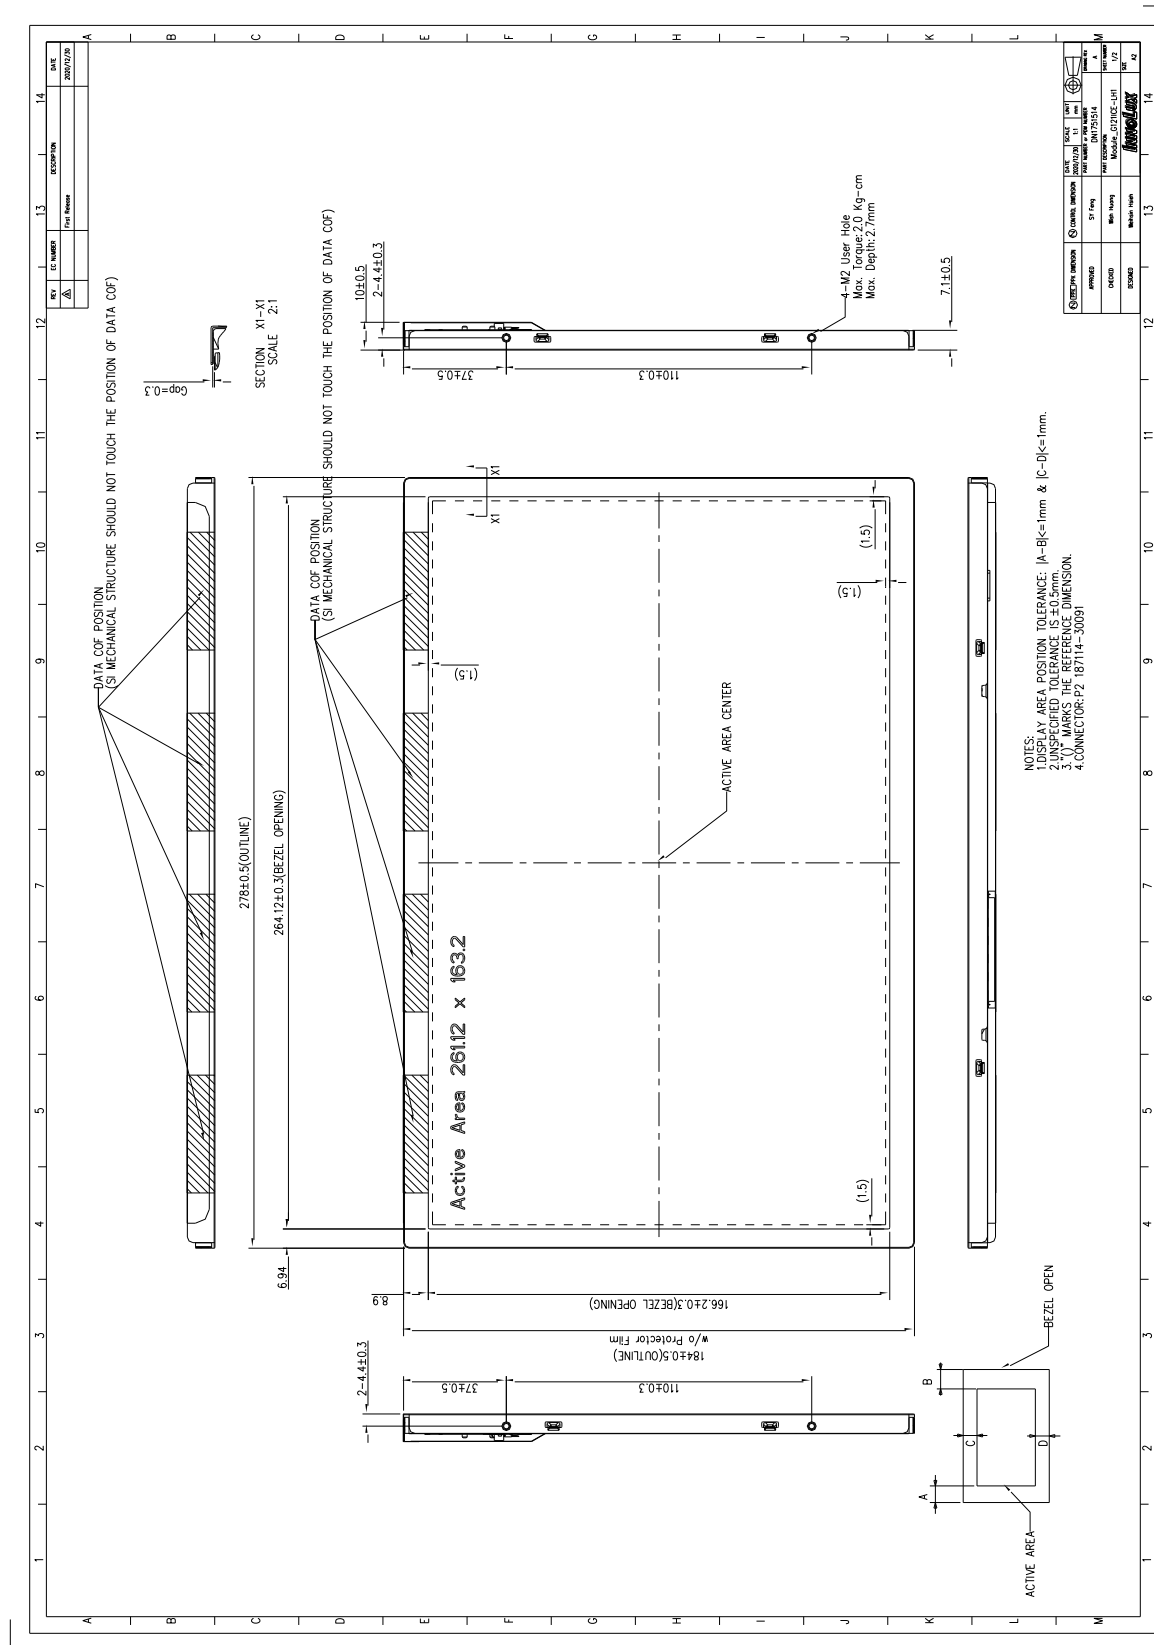

11.2 STORAGE PRECAUTIONS

- (1) When storing for a long time, the following precautions are necessary.
 - (a) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 30°C at humidity 50+-10%RH.
 - (b) The polarizer surface should not come in contact with any other object.
 - (c) It is recommended that they be stored in the container in which they were shipped.
 - (d) Storage condition is guaranteed under packing conditions.
 - (e) The phase transition of Liquid Crystal in the condition of the low or high storage temperature will be recovered when the LCD module returns to the normal condition
- (2) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (3) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (4) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of lamp will be higher than the room temperature.

11.3 OTHER PRECAUTIONS

- (1) Normal operating condition
 - (a) Display pattern: dynamic pattern (Real display)
 - (Note) Long-term static display can cause image sticking.
- (2) Operating usages to protect against image sticking due to long-term static display
 - (a) Static information display recommended to use with moving image.
- (3) Abnormal condition just means conditions except normal condition.

12. MECHANICAL CHARACTERISTICS

Appendix. SYSTEM COVER DESIGN NOTICE

1	Set Chassis and IAVM Module touching Mode
 <p>The diagram illustrates three different methods for connecting a green 'Module' to an orange 'Chassis'. 1. Top: A red 'X' indicates a discouraged method using a 'spring' for contact. 2. Middle: A black triangle indicates a recommended method using 'Flat sheet metal' for contact. 3. Bottom: A blue circle indicates a recommended method using an 'EMI Shielding Gasket (Tape/ Sponge)' for contact.</p>	<p>Module</p> <p>Chassis</p> <p>spring</p> <p>Module</p> <p>Chassis</p> <p>Flat sheet metal</p> <p>Module</p> <p>Chassis</p> <p>EMI Shielding Gasket (Tape/ Sponge)</p>
Definition	<p>a. To prevent from abnormal display & white spot after mechanical test, it is not recommended to use spring type chassis.</p> <p>b. We suggest the contact mode between Chassis and Module rear cover is Tape/Sponge, second is Flat sheet metal type chassis.</p>

2	Tape/Sponge design on system inner surface
	 <p>The top diagram shows a cross-section of the system inner surface. A green 'Module' is mounted on a yellow 'Chassis'. A red 'Tape/ Sponge' is applied between the module and the chassis. A blue 'System rear bezel' is shown on the right. The bottom two diagrams show top-down views of the module. The middle diagram, marked with a red 'X', shows four red 'Tape/ Sponge' pieces placed at the corners of the module. The bottom diagram, marked with a blue circle, shows a single red 'Tape/ Sponge' piece placed around the perimeter of the module.</p>
Definition	<p>a. To prevent from abnormal display & white spot after mechanical test, we suggest using Tape/Sponge as medium between chassis and Module rear cover could reduce the occurrence of white spot.</p> <p>b. When using the Tape/Sponge, we suggest it be lay over between set chassis and Module rear cover. It is not recommended to add Tape/Sponge in separate location. Since each Tape/Sponge may act as pressure concentration location.</p>

3	System inner surface examination
	
Definition	<p>a. The hatch area on Module PCBA should keep at least 1mm gap(X,Y,Z direction) to any structure with system cover inner surface.</p> <p>b. Burr, Step, PCB protrusion may cause stress concentration. White spot may occur during reliability test.</p>

4	Material used for system rear-cover
	
Definition	<p>System rear-cover material with high rigidity is needed to resist deformation during scuffing test, hinge test, pogo test or backpack test. Abnormal display, white spot, pooling issue may occur if low rigidity material is used. Pooling issue may occur because screw's boss position for module's bracket are deformed open-close test. Solid structure design of system rear-cover may also influence the rigidity of system rear-cover. The deformation of system rear-cover should not caused interference.</p>

5	Assembly SOP examination for system front-cover with hook structure
 <p>The diagram shows a cross-sectional view of the assembly process. A green rectangular 'Module' is being inserted into a blue 'System front-cover'. The front-cover has a 'hook' on its side that fits into the 'System rear-cover' (a light blue L-shaped piece). Arrows indicate the correct (green circle with yellow arrow pointing down) and incorrect (red circle with yellow arrow pointing down) directions for the front-cover assembly. Similarly, arrows at the bottom indicate correct (green circle with yellow arrow pointing up) and incorrect (red circle with yellow arrow pointing up) directions for the rear-cover assembly.</p>	
Definition	To prevent panel crack during system front-cover assembly process with hook structure, it is not recommended to press panel or any location that relate directly to the panel.

6	Permanent deformation of system cover after reliability test
	<p>The diagrams illustrate various failure modes of the system cover after reliability testing. Each diagram shows a green 'Module' between a blue 'System front-cover' and a cyan 'System rear-cover'. - Diagram 1 (Blue circle): Shows the front cover deformed upwards, labeled 'deformation'. - Diagram 2 (Red X): Shows the rear cover deformed upwards, labeled 'deformation'. - Diagram 3 (Blue circle): Shows the front cover deformed downwards, labeled 'deformation'. - Diagram 4 (Red X): Shows the rear cover deformed downwards, labeled 'deformation'. - Diagram 5 (Red X): Shows a '0 gap' between the module and the rear cover. - Diagram 6 (Red X): Shows the rear cover deformed upwards, labeled 'deformation'.</p>
Definition	<p>System cover including front cover and rear cover may deform during reliability test. Permanent deformation of system front cover and rear cover after reliability test should not interfere with panel. Because it may cause issue such as pooling, abnormal display, white spot and also cell creak.</p> <p>Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>

7	Design gap A between panel & any components on system rear-cover
	
Definition	<p>System cover including front cover and rear cover may deform during reliability test. Permanent deformation of system front cover and rear cover after reliability test should not interfere with panel. Because it may cause issue such as pooling, abnormal display, white spot and also cell crack.</p> <p>Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>

8	Design gap B between system front-cover & panel surface
	
Definition	<p>Gap between system front-cover & panel surface is needed to prevent pooling or glass broken. Zero gap or interference such as burr and warpage from mold frame may cause pooling issue near system front-cover opening edge. This phenomenon is obvious during swing test, hinge test, knock test or during pooling inspection procedure.</p> <p>To remain sufficient gap, design with system rib higher than maximum panel thickness is recommended.</p> <p>Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>

9	Design gap C between panel & system front-cover or protrusions
 <p>The diagrams show two cross-sectional views of a module assembly. In both, a green 'Module' is shown. In the top view, the module is sandwiched between a cyan 'System rear-cover' and a blue 'System front-cover'. A gap 'C' is indicated between the module and the front-cover. In the bottom view, the module is on a cyan 'System rear-cover' with a blue 'System front-cover' on top. A gap 'C' is indicated between the module and the front-cover. Blue arrows point to the gap 'C' in both diagrams.</p>	
Definition	<p>Gap between panel & system front-cover or protrusions is needed to prevent shock test failure. Because system front-cover or protrusions with small gap may hit panel during the test. Issue such as cell crack, abnormal display may occur.</p> <p>The gap should be large enough to absorb the maximum displacement during the test. Note: If the interference cannot be avoided, please feel free to contract INX FAE Engineer for collaboration design. We can help to verify and pass risk assessment for customer reference.</p>

10	Design distance between TP AA to LCD AA
 <p>The diagram shows a cross-section of the module assembly. From top to bottom, the layers are: TP (Touch Panel), TP VA (TP Ink), TP INK, Sponge, and MODULE Frame. The distance between the TP VA and the LCD AA is marked with a red double-headed arrow. The LCD AA is indicated by a red dashed line. The TP VA is indicated by a red dashed line. The TP INK is indicated by a red dashed line. The Sponge is indicated by a red dashed line. The MODULE Frame is indicated by a red dashed line.</p>	
Definition	<p>TP VA should avoid TP ink area covering LCD AA or causing the module frame to be exposed.</p>

11	Use OCR Lamination
 <p>The diagram illustrates the correct application of OCR (Optical Clear Resin) lamination to prevent line pooling. The top section shows a cross-section of a display module with a 'TP or Cover Glass' layer. Red arrows labeled 'Line pooling' point to the edges of the display area. A red 'X' in a circle and an upward arrow 'F' indicate a negative example. The bottom section shows a similar cross-section but with 'OCR' applied to the edges of the display area, indicated by a green circle and an upward arrow 'F'. A detailed inset shows the 'OCR overflow' and 'Add Side glue' process, with labels for 'TP' and 'OCR'.</p>	
Definition	<p>1. OCR glue as possible beyond module, in order to avoid Line Pooling</p> <p>2. Add side glue to avoid Line Pooling</p>
