Note 1: The rating is defined for the signal voltages of the interface such as CLK and pixel data pairs.

Note 2: The maximum rating is defined as above based on the panel surface temperature, which might be different from ambient temperature after assembling the panel into the application. Moreover, some temperature-related phenomenon as below needed to be noticed:

- Background color, contrast and response time would be different in temperatures other than $25\,^{\circ}\mathrm{C}$.
- Operating under high temperature will shorten LED lifetime.

Note 1: VCM 1.2V is common mode voltage of LVDS transmitter and receiver. The input terminal of LVDS transmitter is terminated with 100Ω .

Note 2: An all white check pattern is used when measuring I_{DD}. *f*_{Frame} is set to 60 Hz. Moreover, 0.5A fuse is applied in the module for I_{DD}. For display activation and protection purpose, power supply is recommended larger than 1.25A to start the display and break fuse once any short circuit occurred.

- Note 1: As Fig. 5.1 shown, LED current is constant, 380 mA, controlled by the LED driver when applying 12V.
- Note 2: Dimming function can be obtained by applying PWM signal from the display interface DIM (No.6pin) of CN2. The recommended PWM signal is 200Hz ~ 1K Hz with 3.3V amplitude.
- Note 3: The estimated lifetime is specified as the time to reduce 50% brightness by applying 380 mA at 25° C.

6. OPTICAL CHARACTERISTICS

The optical characteristics are measured based on the conditions as below:

- Supplying the signals and voltages defined in the section of electrical characteristics.
- The backlight unit needs to be turned on for 30 minutes.
- The ambient temperature is 25 $^{\circ}\mathrm{C}$.
- In the dark room less than 100lx, the equipment has been set for the measurements as shown in Fig 6.1.

$$T_a = 25 \, {}^{\circ}C, \, f_{Frame} = 60 \, \text{Hz}, \, \text{Vdd} = 3.3 \text{V}$$

Note 1: The brightness is measured from the panel center point, P5 in Fig. 6.2, for the typical value.

Note 2: The brightness uniformity is calculated by the equation as below:

$$Brightness\ uniformity = \frac{Min.\ Brightness}{Max.\ Brightness} \times 100\%$$

, which is based on the brightness values of the 9 points measured by BM-5 as shown in Fig. 6.2.

Note 3: Continuously operating the test pattern (see below chess pattern Fig.6.3) on display for 2 hours at 25°C then switch to completely white pattern, the previous test pattern shall disappear within 2 seconds.

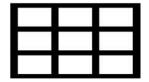

Fig.6.3

Note 4: The Contrast Ratio is measured from the center point of the panel, P5, and defined as the following equation:

$$CR = \frac{Brightness of White}{Brightness of Black}$$

Note 5: The definition of response time is shown in Fig. 6.4. The rising time is the period from 10% brightness to 90% brightness when the data is from black to white. Oppositely, Falling time is the period from 90% brightness falling to 10% brightness.

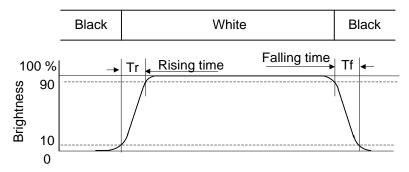

Fig.6.4

Note 6: The definition of viewing angle is shown in Fig. 6.5. Angle ϕ is used to represent viewing directions, for instance, $\phi = 270^{\circ}$ means 6 o'clock, and $\phi = 0^{\circ}$ means 3 o'clock. Moreover, angle θ is used to represent viewing angles from axis Z toward plane XY.

The display is super wide viewing angle version, so that the best optical performance can be obtained from every viewing direction.

Note 7: The color chromaticity is measured from the center point of the panel, P5, as shown in Fig. 6.2.

- Note 1: Display functionalities are inspected under the conditions defined in the specification after the reliability tests.
- Note 2: The display is not guaranteed for use in corrosive gas environments.
- Note 3: Under the condition of high temperature & humidity, if the temperature is higher than $40\,^{\circ}\mathrm{C}$, the humidity needs to be reduced as Fig. 8.1 shown.
- Note 4: All pins of LCD interface (CN1) have been tested by ± 100 V contact discharge of ESD under non-operating condition.

9.3 TIME TABLE

The column of timing sets including minimum, typical, and maximum as below are based on the best optical performance, frame frequency (f_{Frame}) = 60 Hz to define. If 60 Hz is not the aim to set, 55~65 Hz for f_{Frame} is recommended to apply for better performance by other parameter combination as the definitions in section 5.1.

9.6 POWER SEQUENCE

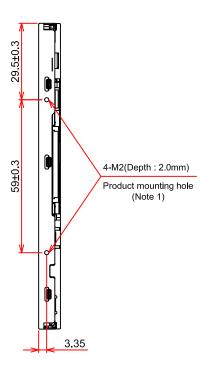

- Note 1: In order to avoid any damages, V_{DD} has to be applied before all other signals. The opposite is true for power off where V_{DD} has to be remained on until all other signals have been switch off. The recommended time period is 1 second.
- Note 2: In order to avoid showing uncompleted patterns in transient state. It is recommended that switching the backlight on is delayed for 1 second after the signals have been applied. The opposite is true for power off where the backlight has to be switched off 1 second before the signals are removed.
- Note 3: In order to avoid high Inrush current, V_{DD} rising time need to set more than 0.5ms.

11. APPEARANCE STANDARD

The appearance inspection is performed in a dark room around 500~1000 lx based on the conditions as below:

- The distance between inspector's eyes and display is 30 cm.
- The viewing zone is defined with angle θ shown in Fig. 11.1 The inspection should be performed within 45° when display is shut down. The inspection should be performed within 5° when display is power on.

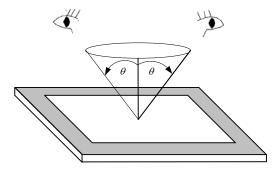

Fig. 11.1

11.1 THE DEFINITION OF LCD ZONE

LCD panel is divided into 3 areas as shown in Fig.11.2 for appearance specification in next section. A zone is the LCD active area (dot area); B zone is the area, which extended 1 mm out from LCD active area; C zone is the area between B zone and metal frame.

In terms of housing design, B zone is the recommended window area customers' housing should be located in.

11.2 LCD APPEARANCE SPECIFICATION

The specification as below is defined as the amount of unexpected phenomenon or material in different zones of LCD panel. The definitions of length, width and average diameter using in the table are shown in Fig. 11.3 and Fig. 11.4.

Note 1: The definitions of dot defect are as below:

- For bright dot-defect, showing black pattern, defect size over 1/2 dot area is defined.
- For dark dot-defect, showing white pattern, defect size over 1/2 dot area is defined.
- The definition of 1-dot-defect is the defect-dot, which is isolated and no adjacent defect-dot.
- The definition of adjacent dot is shown as Fig. 11.5.

Note 2: The inspection method with ND Filter is to hold it in front of the panel around 1 cm and inspect the panel with 35±5 cm distance for 1 second.

12. PRECAUTIONS

12.1 PRECAUTIONS OF ESD

- 1) Before handling the display, please ensure your body has been connected to ground to avoid any damages by ESD. Also, do not touch display's interface directly when assembling.
- 2) Please remove the protection film very slowly before turning on the display to avoid generating ESD.

12.2 PRECAUTIONS OF HANDLING

- 1) In order to keep the appearance of display in good condition, please do not rub any surfaces of the displays by using sharp tools harder than 3H, especially touch panel, metal frame and polarizer.
- 2) Please do not stack the displays as this may damage the surface. In order to avoid any injuries, please avoid touching the edge of the glass or metal frame and wore gloves during handling.
- 3) Touching the polarizer or terminal pins with bare hand should be avoided to prevent staining and poor electrical contact.
- 4) Do not use any harmful chemicals such as acetone, toluene, and isopropyl alcohol to clean display's surfaces.
- 5) Please use soft cloth or absorbent cotton with ethanol to clean the display by gently wiping. Moreover, when wiping the display, please wipe it by horizontal or vertical direction instead of circling to prevent leaving scars on the display's surface, especially polarizer.
- 6) Please wipe any unknown liquids immediately such as saliva, water or dew on the display to avoid color fading or any permanent damages.
- 7) Maximum pressure to the surface of the display must be less than 1.96×10^4 Pa. If the area of applied pressure is less than 1 cm², the maximum pressure must be less than 1.96N.

12.3 PRECAUTIONS OF OPERATING

- 1) Please input signals and voltages to the displays according to the values defined in the section of electrical characteristics to obtain the best performance. Any voltages over than absolute maximum rating will cause permanent damages to this display. Also, any timing of the signals out of this specification would cause unexpected performance.
- 2) When the display is operating at significant low temperature, the response time will be slower than it at 25 °C . In high temperature, the color will be slightly dark and blue compared to original pattern. However, these are temperature-related phenomenon of LCD and it will not cause permanent damages to the display when used within the operating temperature.
- 3) The use of screen saver or sleep mode is recommended when static images are likely for long periods of time. This is to avoid the possibility of image sticking.
- 4) Spike noise can cause malfunction of the circuit. The recommended limitation of spike noise is no bigger than \pm 100 mV.

12.4 PRECAUTIONS OF STORAGE

If the displays are going to be stored for years, please be aware the following notices.

- 1) Please store the displays in a dark room to avoid any damages from sunlight and other sources of UV light.
- 2) The recommended long term storage temperature is between 10 °C ~35 °C and 55%~75% humidity to avoid causing bubbles between polarizer and LCD glasses, and polarizer peeling from LCD glasses.
- 3) It would be better to keep the displays in the container, which is shipped from JDI, and do not unpack it.
- 4) Please do not stick any labels on the display surface for a long time, especially on the polarizer.

13. DESIGNATION OF LOT MARK

1) The lot mark is showing in Fig.13.1. First 4 digits are used to represent production lot, T represented made in Taiwan, and the last 6 digits are the serial number.

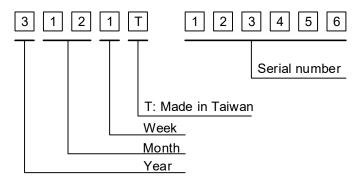

Fig. 13.1

2) The tables as below are showing what the first 4 digits of lot mark are shorted for.

| Year | Lot Mark |
|------|----------|
| 2023 | 3 |
| 2024 | 4 |
| 2025 | 5 |
| 2026 | 6 |

| 8~14 days | 2 |
| 15~21 days | 3 |
| 22~28 days | 4 |
| 29~31 days | 5 |

3) Except letters I and O, revision number will be shown on lot mark and following letters A to Z.

| REV. No | Item | Remarks |
|---------|------|---------|
| Α | - | - |

4) The location of the lot mark is on the back of the display shown in Fig. 13.2.
