### 4. ABSOLUTE MAXIMUM RATINGS

Item	Symbol	Min.	Max.	Unit	Remarks
Supply Voltage	$V_{DD}$	0	7.0	V	-
Input Voltage of Logic	Vı	-0.3	V <sub>DD</sub> +0.3	V	Note 1
Operating Temperature	T <sub>OP</sub>	-20	70	°C	Note 2
Storage Temperature	T <sub>ST</sub>	-30	80	°C	Note 2

- Note 1: The rating is defined for the signal voltages of the interface such as DE, Hsync, Vsync, CLK and RGB data bus.
- Note 2: The maximum rating is defined as above based on the chamber temperature, which might be different from ambient temperature after assembling the panel into the application. Moreover, some temperature-related phenomenon as below needed to be noticed:
  - Background color, contrast and response time would be different in temperatures other than 25°C.
  - Operating under high temperature will shorten LED lifetime.

#### 5. ELECTRICAL CHARACTERISTICS

#### 5.1 LCD CHARACTERISTICS

 $T_a = 25$  °C, Vss = 0V

Item	Symbol	Condition	Min.	Тур.	Max.	Unit	Remarks

- Note 2: An all black check pattern is used when measuring  $I_{DD}$ ,  $f_{Frame}$  is set to 60 Hz.
- Note 3: 1.0A fuse is applied in the module for I<sub>DD</sub>. For display activation and protection purpose, power supply is recommended larger than 2.5A to start the display and break fuse once any short circuit occurred.

#### 5.2 BACKLIGHT CHARACTERISTICS

$$T_a = 25 \, ^{\circ}C$$

Item	Symbol	Condition	Min.	Тур.	Max.	Unit	Remarks

- Note 1: Fig. 5.1 shows the LED backlight circuit. The circuit has 27 LEDs in total and R is  $243\,\Omega$ .
- Note 2: The estimated lifetime is specified as the time to reduce 50% brightness by applying 108 mA at  $25\,^{\circ}\mathrm{C}$ .

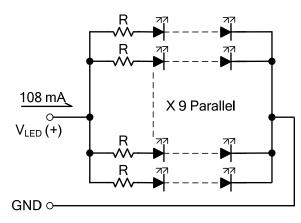

Fig. 5.1

### 6. OPTICAL CHARACTERISTICS

The optical characteristics are measured based on the conditions as below:

- Supplying the signals and voltages defined in the section of electrical characteristics.
- The backlight unit needs to be turned on for 30 minutes.
- The ambient temperature is 25°C.
- In the dark room less than 100 lx, the equipment has been set for the measurements as shown in Fig 6.1.

$T_a$	= 25	$^{\circ}C$ , $f_{Frame}$	=	60 Hz,	$V_{DD} = 3.3V$

	vviile	Y		0.25	0.30	0.35				

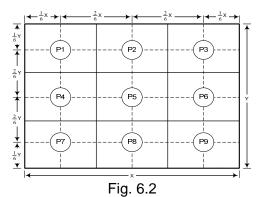

Note 1: The brightness is measured from the center point of the panel, P5 in Fig. 6.2, for the typical value.

Note 2: The brightness uniformity is calculated by the equation as below:

Brightness uniformity = 
$$\frac{\text{Min. Brightness}}{\text{Max. Brightness}}$$
 X100%

Which is based on the brightness values of the 9 points measured by BM-5 as shown in Fig. 6.2.

KAOHSIUNG OPTO-ELECTRONICS INC

Note 3: The Contrast ratio is measured from the center point of the panel, P5, and defined as the following equation:

CR = Brightness of White
Brightness of Black

Note 4: The definition of response time is shown in Fig. 6.3. The rising time is the period from 90% brightness to 10% brightness when the data is from white to black. Oppositely, Falling time is the period from 10% brightness rising to 90% brightness.

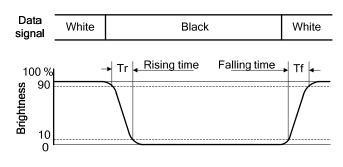

Fig. 6.3

Note 5: The definition of viewing angle is shown in Fig. 6.4. Angle  $\phi$  is used to represent viewing directions, for instance,  $\phi = 270^{\circ}$  means 6 o'clock, and  $\phi = 0^{\circ}$  means 3 o'clock. Moreover, angle  $\theta$  is used to represent viewing angles from axis Z toward plane XY.

The viewing direction of this display is 12 o'clock, which means that a photograph with gray scale would not be reversed in color and the brightness change would be less from this direction. However, the best contrast peak would be located at 6 o'clock.

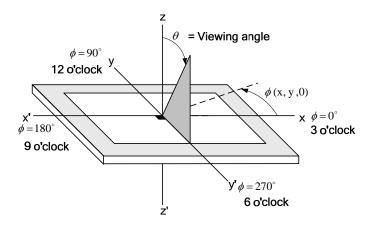

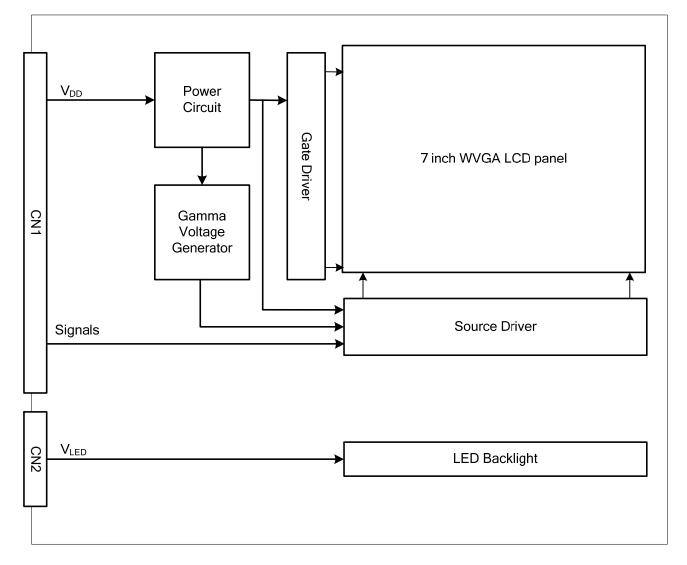

Fig. 6.4

Note 6: The color chromaticity is measured from the center point of the panel, P5, as shown in Fig. 6.2.

As shown in Fig. 11.2, applying voltage meter to measure Va, Vb and Vxm, where Va is the maximum voltage in the active area; Vb is the minimum voltage in the active area; Vxm is the measured voltage of point x selected by random. Afterwards, the linearity can be calculated by following equation:

$$Linearity = \frac{|Vxi - Vxm|}{Va - Vb} \times 100\%,$$

where Vxi is the idea voltage of point x.

The method to measure the linearity of Y-axis is the same as above.

#### 13. PRECAUTIONS

#### 13.1 PRECAUTIONS of MOUNTING

- 1) Please refer to Fig. 13.1 for housing the display with touch panel into applications. The Fig. 13.1 shows some points as below:
- The cushion needs to be designed between housing and touch panel in order to avoid unexpected pressure to cause any wrong reactions, and the cushion should be located in the insulated area.
- The housing should not cover the active area of touch panel as the figure shown.

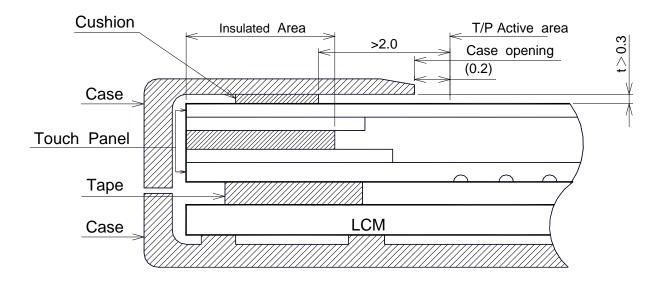

Fig 13.1

#### 13.2 PRECAUTIONS of ESD

- 1) Before handling the display, please ensure your body has been connected to ground to avoid any damages by ESD. Also, do not touch display's interface directly when assembling.
- 2) Please remove the protection film very slowly before turning on the display to avoid generating ESD.

#### 13.3 PRECAUTIONS of HANDLING

- 1) In order to keep the appearance of display in good condition, please do not rub any surfaces of the displays by sharp tools harder than 3H, especially touch panel, metal frame and polarizer.
- 2) Please do not stack the displays as this may damage the surface. In order to avoid any injuries, please avoid touching the edge of the glass or metal frame and wore gloves during handling.
- 3) Touching the polarizer or terminal pins with bare hand should be avoided to prevent staining and poor electrical contact.
- 4) Do not use any harmful chemicals such as acetone, toluene, and isopropyl alcohol to clean display's surfaces.
- 5) Please use soft cloth or absorbent cotton with ethanol to clean the display by gently wiping. Moreover, when wiping the display, please wipe it by horizontal or vertical direction instead of circling to prevent leaving scars on the display's surface, especially polarizer.
- 6) Please wipe any unknown liquids immediately such as saliva, water or dew on the display to avoid color fading or any permanently damages.

KAOHSIUNG OPTO-ELECTRONICS INC.	SHEET NO.	7B64PS 2713-TX18D44VM2BPA-4	PAGE	13-1/2
---------------------------------	--------------	-----------------------------	------	--------

7) Maximum pressure to the surface of the display must be less than  $^{1,96 \times 10^4}$  Pa. If the area of adding pressure is less than 1 cm<sup>2</sup>, the maximum pressure must be less than 1.96N.

#### 13.4 PRECAUTIONS OF OPERATING

- 1) Please input signals and voltages to the displays according to the values defined in the section of electrical characteristics to obtain the best performance. Any voltages over than absolute maximum rating will cause permanent damages to this display. Also, any timing of the signals out of this specification would cause unexpected performance.
- 2) When the display is operating at significant low temperature, the response time will be slower than it at 25 °C. In high temperature, the color will be slightly dark and blue compared to original pattern. However, these are temperature-related phenomenon of LCD and it will not cause permanent damages to the display when used within the operating temperature.
- 3) The use of screen saver or sleep mode is recommended when static images are likely for long periods of time. This is to avoid the possibility of image sticking.
- 4) Spike noise can cause malfunction of the circuit. The recommended limitation of spike noise is no bigger than  $\pm 100$  mV.

#### 13.5 PRECAUTIONS of STORAGE

If the displays are going to be stored for years, please be aware the following notices.

- 1) Please store the displays in a dark room to avoid any damages from sunlight and other sources of UV light.
- 2) The recommended long term storage temperature is between 10 °C ~35 °C and 55%~75% humidity to avoid causing bubbles between polarizer and LCD glasses, and polarizer peeling from LCD glasses.
- 3) It would be better to keep the displays in the container, which is shipped from KOE, and do not unpack it.
- 4) Please do not stick any labels on the display surface for a long time, especially on the polarizer.
